Self-Walking Rotary Press-in Method for Tubular Piles with Tip Bit

Gyropress Method

Introduction

Social infrastructures, such as roads, rivers, bridges, and levees, protect our life and property, and provide comfortable and cultural life. However, it is required to re-evaluate many of them in terms of "objective", "function" and "location" due to physical degrading by long time use, rapid urbanisation and changes in public demand.

Despite such requirement, many of these social infrastructures are concrete constructions, which are very difficult to be dismantled, removed, or added additional functions. The major factors are that they are constructed without plans of dismantling and removal, and that there are many physical restrictions for such works because of congested building urbanization.

Gyropress Method resolves these problems by its new concepts of construction method and structure design. This method enables to install tubular piles with cutting bits attached on piles toe by rotary jack-in system without removing existing underground structures. The installed piles form the both foundation structure and building structure. This method is developed based on the "advantages of the press-in principle" which have over 30 year achievements, and enables to carry out structure regeneration works and reinforcement works with preserving the "Five Construction Principles".

Structures constructed by Gyropress Method can be dismantled and removed. It means, it is possible to plan future functional improvements, restorations to original environment (restoration of nature), relocation, and recycling of construction materials at the design stage.

Overview of Gyropress Method

Realisation of pile penetration by the tubular piles with gyropress coring bits and "Gyropress Force" generated from press-in & gyration.

Features of Gyropress Method

Penetrating through Hard Ground and Concrete Obstructions

Press-in Method is available where ground condition is so hard that conventional methods cannot overcome and where there is underground obstacle such as concrete structures.

Working Under Physical Restrictions (GRB System)

Because Press-in Method can provide piling condition with minimum working area, it is the best to be selected for working under severe physical restrictions such as narrow locations and underneath overhead obstructions. In addition, it does not require temporary working platforms.

Environmentally-friendly Construction (Controlling Soil Displacement/Environmentally-friendly considerations)

Soil displacement can be minimised by leveraging rotary cutting mechanism with special bits on the pile toe. It makes the piling work more environmentally-friendly.

Furthermore biodegradable oil and grease are adopted to the Gyro Piler. They are naturally degraded and do not damage ecologic system, if they are flown out into water or soil in any possibility.

Adoption of Large-Diameter Piles allows Economical Constructions

Gyro Piler can be used for variety of pile diameter sizes, pile arrangements and the combination of batter piles. It allows to select economically optimal structure design.

Construction works can be carried out with Environmentally-friendly considerations, lower cost and shorter work duration at any work conditions.

Epoch-making Design Concept for Regeneration and Reinforcement of Function without Removing Underground Structure.

Gyropress Method can carry out regeneration works and reinforcement works without removing underground structures. Gyro Piler can directly install structural material which eventually forms both foundation part and structural part With Gyropress Method, construction works can be carried out with less work processes and least negative impact to surrounding environment including economic activities. In addition, the completed structure has ideal level of quality.

Application of Road Widening Work

Cutting Reinforced Concrete

The followings present cutting off performance through reinforced concrete (t = 80 cm, σ_{ck} = 24 N/mm², D16@250 x 3 layers).

Overcoming various ground conditions by selecting bit arrangements.

GRB System for "Temporary Work Less" Construction

GRB system is the construction technology which performs all of piling works such as pile conveying, pile pitching and press-in work on top of completed piles. With the press-in machine (Gyro Piler) in the front, Power Unit as a power source, Clamp Crane to pitch piles and Pile Runner to convey piles from work base perform on top of pile head as working orbit. All machines are self-supported by holding existing piles with less risk of overturning. Temporary working platform or detour road is not required even at waterfront, narrow land, slope and low overhead clearance condition since influence range of work is minimised to just the width of those machinery. GRB System enables to construct just wall structure which is its original purpose of construction without any temporary works.

Standard Machine Layout

GRB System

Construction Revolution Gyropress Method

S Riverbank Reinforcement

Gyropress Method can be applied for tough work conditions such as flood countermeasure works and seismic countermeasure works at residential areas. Because Gyro Piler can install piles through existing underground structure, the piling work can be carried out without disturbing cross-section area of river and active vessel traffics.

Reference

Riverbank Construction Work at South Feeder Stream, OYOKOGAWA-River Tokyo, Japan

A riverbank protection work was carried out with GRB System. Piles were installed through existing structure at a narrow canal where there is no access for a large barge crane.

Before Construction

Road Retaining Wall

Reference Retaining Wall Construction Work for KASEDA Road Widening

Press-in into shaley sandstone layer (Extrapolated SPT N Value: 750) A compact construction work with consideration for surrounding environment at the narrow land between a hospital and a prefectural road.

Construction Revolution Gyropress Method

Retaining wall can be easily constructed by continuos tubular pile wall with interlock pieces. Urban function is able to be evolved without disturbing active traffic and surrounding environment even at urban congested area by GRB System that various construction machines such as Clamp Crane, and other associated machines work on the top of tubular piles.

Kagoshima, Japan

Construction under Overhead Clearance Restriction

Construction work can be carried out at beneath overhead obstruction, because Gyro Piler is compact and gripping position of pile being pressed-in is close to the pile top of competed piles. Especially in case of severe height restriction, Gyro Clear Piler, a specially designed Gyro Piler with short height, should be selected.

Reference Furukawa River Renovation Work

Tokyo, Japan

Construction Work at Low Overhead Clearance (6.0m) with Gyro Clear Piler.

A new bank protection work with penetrating existing protection bank without giving any impact on current surrounding functions.

🚺 Batter Pile Press-in

Reference Reinforcement Construction Work at TOMISUHARA Harbor

Batter piles were installed by Gyro Piler for reinforcement of a tubular sheet pile wall.

Construction Revolution Gyropress Method

Gyro Piler has a lateral tilting function. It enables to install batter piles and anchor piles. Gyro Piler can construct high modulus retaining walls.

Mie, Japan

Auxiliary Equipment

Lubrication System Water Hose Water Pipe Generator Tap Wate * Water Supply by Tap Water or Submerged Pump Water Outlet (Inside the tubular pile)

Crane Attachment

* Example for using water as lubricant.

Input Voltage (3 phases)	AC200V, 50/60Hz, 24KVA or more
Water Pump Discharge Rate	Max. 60 ℓ/min
Water Pump Discharge Pressure	Max. 6 MPa
Outer Dimensions (W x D x H)	1505 × 755 × 1230 mm
Water Tank Capacity	300 L
Mass (without water)	410 kg

Driving Attachment

The attachment is used to install closure piles follolwing the tubular pile installation.

Attach the Driving Attachment into the Chuck and set out the closure pile at installation position.

Install the closure pile to the required depth.

Standard Press-in Procedures

Standard Installation

Press-in from 4 the Reaction Stand

Set the Driving Attachment and then press-in up to the datum level.

tubular pile (5), move up main body

Lower the main body and complete self-walking. Remove the Driving Attachment. Then, repeat steps 1 though 6.

THE FIVE CONSTRUCTION PRINCIPLES

If we analyse all the parties involved in any construction work, we can categorise them into three main groups: the client, the contractor and the general public. The ideal situation is when all three parties are in agreement and satisfied with the successful outcome of the construction work. Problems arise when one of the parties becomes a victim of imbalance in this relationship. The conventional construction methods based upon principles that "more is paid for less efficient work" are no longer appropriate to present-day society. Universally acceptable construction methods must embody the Five Construction Principles.

Environmental Protection	Construction work should be environmentally friendly and free from pollution.
Safety	Construction work has to be carried out in safety and comfort with a method implementing the highest safety criteria.
Speed	Construction work should be completed in the shortest possible period of time.
Economy	Construction work must be done rationally with an inventive mind to overcome all constraints at the lowest cost.
Aesthetics	Construction work must proceed smoothly and the finished product should portray cultural and artistic flavour.
